

## COMPX323 Milestone 3

### **Application – extended with MongoDB**

A username and password is required for connecting to MongoDB at the university. If your group has not received these then contact me. Use your application from milestone 2 and extend it with the following functionality:

Create a MongoDB version of your Oracle database and fill it with some data (similar to your small dataset in Oracle).

Replicate the core functionality of your application (data reading from DB, data change in interface, data writing to DB) in a second tab / area in your application. This time, connect to your MongoDB collections instead of your oracle tables.

Again, your system input needs to be error proof with appropriate user messages. Documentation is to include

- Data structure and data in MongoDB
- Screenshots that show your application in action.

### **Deadline: Thursday 3rd June 10am**

Hand in all milestones together!

Details of project demonstrations will be made available on Moodle. Currently, the plan is 10 minutes per group in the lab during the lab and lecture slots on 3rd and 4th June.
